HALFEN HZA-PS POWER SOLUTION
Technical Product Information

NEW Seismic C1/ C2 assessment report and ETA-17/0728 for HZA-PS 53/34
HALFEN HZA-PS POWER SOLUTION
HALFEN Cast-in Channels for Power Plants

Standard application
HALFEN HTA-CE and HZA Channels are officially approved and recommended for applications in normal concrete projects; office buildings, schools, industrial buildings or in non-critical areas of nuclear power plants.
In these applications the maximum crack width in the concrete is 0.3 mm. For more information please see the Technical Product Information for HALFEN Cast-in channels. Free download at:
www.halfen.com/brochures/construction/fixing systems/HTA Cast-in channels

Safety relevant applications
Higher safety requirements for exterior (EVA) or interior (EVI) impact loads must be considered in safety relevant areas e.g. in nuclear power plants or other nuclear facilities.
The suitability of the HZA-PS Channels for extraordinary impact loads has been verified in simulated application tests.
All these tests were done in concrete with opening and closing cracks varying from 1.0 mm up to 1.5 mm. The results are summarized in evaluation report 09.05.18-E (see also pages 8 and 9).

Concrete cracks max. 0.3 mm

Larger concrete cracks up to 1.5 mm

HALFEN HZA-PS Cast-in channel

Approvals/European Technical Assessments

Expert Report/European Technical Assessment

Nuclear power plant under construction
HALFEN HZA-PS POWER SOLUTION
HALFEN Cast-in Channels for Power Plants

Approvals
HALFEN Cast-in channels are available in hot-dip galvanized or in stainless steel. Building authority approved by the German Institute of Construction Engineering (DIBt, Deutsches Institut für Bautechnik).

Cast-in channels are embedded in the concrete, flush with the surface. HALFEN T-bolts or serrated t-bolts, nuts and washers are used to reliably attach structural elements to the channels.

Evaluation Report
HALFEN HZA-PS Cast-in channels are suitable for applications in safety relevant areas of nuclear power plants and other nuclear facilities. HALFEN HZA-PS Cast-in channels meet the high requirements for extraordinary impacts from external (EVA) and internal (EVI) loads e.g. earthquakes, plane crash or explosions.

The anchor channels have a fire rating of up to 120 minutes for concrete structures if installed according to the approvals stated above.

Fire Protection
HALFEN HTA and HZA Cast-in channels, in combination with HALFEN Channel bolts, have been certified for use in fire-exposed structural elements.

The new HPD (Health Product Declaration) for hot-dip galvanized HALFEN Cast-in channels helps to achieve additional points in the Leed-v4-system.

Sustainability
An EPD® (Environmental Product Declaration) provides transparent and comparable ecological data which helps to evaluate the sustainability of a building.

The approvals can be found at: www.halfen.com/downloads/brochures

Quality
The HALFEN GmbH subsidiaries are Quality Management certified according to ISO 9001:2015, Certificate no. 202384-2016-AQ-DaKkS.

The new HPD (Health Product Declaration) for hot-dip galvanized HALFEN Cast-in channels helps to achieve additional points in the Leed-v4-system.

Examples of previous projects developed using BIM can be found at www.halfen.com/Service/BIM/BIM references.

HALFEN HZA-PS POWER SOLUTION
HALFEN Cast-in Channels for Power Plants

The anchor head
The wide, almost parallel anchor head is a positively interlock connection and results in very effective load transmission due to the low bearing pressure under the head. Furthermore, there is an additional enormous advantage when used in concrete designed for possible wide cracks. With the minor movement of the anchorage system during opening and closing of cracks, a reliable fixing with low deformation can be guaranteed.

Anchoring depth
Deep anchorage guarantees high load capacity and compensates for weakness in the concrete caused by larger cracks. Concrete elements designed for safety relevant areas are generally densely reinforced. The increase in anchorage depth helps to ensure an ideal load distribution into the reinforcement. Simultaneously the channels (maximum height is 44 mm) are easily installed in the standard concrete cover which is about 45–60 mm.

Channel profile
The manufacturing process for hot-rolled channels has allowed a more efficient design of the channel cross section. This results in thicker channel lips which are stronger than the channel backs or sides. This feature prevents lip deformation while providing reliable and efficient transfer of impact loads through the channel profile into the concrete structure. The hot-roll process also prevents deformation over the channel length caused during production and improving the connection of components. Dynamic loads can also be better transmitted as the hot-rolled material has low internal stresses.

Serrated channel lips
A hard-wearing inner serration is formed in the channel lip material during the rolling process. The serrated HALFEN Channel bolts engage with the matching 3.0 mm pitch of the channel serration allowing non-slip, reliable transfer of loads in the longitudinal direction of the channel. The serrated anchor channels are very beneficial for application in seismic zones or other load cases applications; explosion collision loads or similar. To achieve full load capacities in the longitudinal direction of the anchor channels the specified torque has to be observed (see installation instructions).
HALFEN HZA-PS POWER SOLUTION
HALFEN Cast-in Channels for Power Plants

The anchor foot
The anchor foot is welded on all four edges to the back of the channel. This ensures efficient and even transfer of static loads and critical dynamic loads from the channel into the anchor.

The extensive weld length is an additional safety feature. This is improved on with regular, selective ultimate load tests of welded anchors in our quality assurance programme.

HALFEN Channel bolts (serrated)
Without exception all HZS Channel bolts for the HZA-PS Systems are only available in high strength grade 8.8. This ensures reliable transfer of loads into the channel, even if an additional moment acts on the bolt.

A specified torque is applied to ensure a positive lock between the bolt and the serration in the channel. The specified torque is critical to ensure full load capacity in the longitudinal channel direction. It is important that the torques specified in the installation instructions are observed.

Seismic performance categories C1/C2
assessment report for HZA-PS 53/34
The seismic assessment and expert reports for the HALFEN anchor channel HZA-PS 53/34 cover the technical specifications of the AFCEN code RCC-CW, which corresponds to the demands of ETAG 001 Annex E (replaced by TR 049). The report provides characteristic seismic resistance R_{0,eq,steel} for each direction and for performance category C1 and C2.

HALFEN Anchor Channels HZA-PS 53/34 fulfil the high requirements of seismic performance category C2 with excellent ductile behaviour, no anchor failure and low displacements.

Quality
All HALFEN production facilities are EN ISO 9001 certified. The certification requires regular maintenance of all machines and continual inspections of all processes at the facilities. HALFEN production facilities are certified for welding processes according to international standard EN ISO 3834-2 and EN 1090. All incoming material must be certified acc. to EN 10204. Chemical, mechanical and geometric material properties are also checked. All products are subject to random quality testing during production which includes ultimate tensile testing. The zinc layer is regularly checked for thickness to ensure good quality corrosion protection.

Certification
According to DIN EN 10204 the following documents may be requested:
Acceptance certificates based on non-specific test (production 2.1 certificate and production 2.2 certificate [a more detailed description]) and acceptance certificates based on specific tests on the delivered product (inspection 3.1 certificate).

The customer can request a 3.1 certificate when placing an order.
A 3.1 certificate issued by a manufacturer confirms the test results of the delivered products fulfil the specified requirements.
HALFEN HZA-PS POWER SOLUTION
HALFEN Cast-in Channels for Power Plants

With more than 90 years of experience HALFEN has become a world leader in providing adjustable anchoring systems.

HALFEN Cold-rolled cast-in channels fulfil all basic requirements for an adjustable, user-friendly and reliable anchoring system. The product family includes hot-rolled channels with optimal characteristics for reliable transfer of dynamic loads. The hot-rolled serrated HALFEN Channels are also suitable for transfer of loads in its longitudinal direction.

A logical complement to the serrated hot rolled channel range, the HZA-PS product range allows application in safety relevant areas of nuclear power stations and facilities.

A dedicated test-programme carried out at the Technical University of Dortmund/Germany confirms suitability of HALFEN Channels HZA-PS 53/34, HZA-PS 38/23 and HZA-PS 29/20 for exceptional loads.

This additional research and the tests assume extreme interior and exterior load-effects caused by earthquakes, explosions and plane impacts.

Main features:
› safety
› reliability
› efficiency
› adjustable bolt connection
› no damage to concrete or reinforcement
› suitable for cracked or non-cracked concrete
› approved for fire-resistant structural elements

Additional features:
› suitable for dynamic loads
› flush with the concrete surface with non-deformed channel lips
› suitable for loads in all directions (serrated channels)
› certified for seismic loads (serrated channels)

Additional features:
› suitable for safety relevant areas and extraordinary loads
› stringent quality management and inspections

HALFEN HZA-PS POWER SOLUTION
HALFEN Cast-in Channels for Power Plants

Various specifications taken from different certifications and categories apply in nuclear power plants and nuclear facilities (see DIN 25449):

Category A3: Load cases which may occur only once during the lifetime of the facility:
- earthquake
- plane crash
- exterior explosion
- interior explosion
- differential pressure
- supporting forces etc.

Category A2: Load cases which are likely to occur less than ten times during the lifetime of the facility.

Category A1: Load cases which are likely to occur more than ten times during the lifetime of the facility.

As a result of the higher demands of category A3 and A2 wider concrete cracks must be considered. Therefore, the behaviour of the anchoring system is examined in additional suitability tests with larger crack widths.

The existing guidelines set by the (DIBt) German Institute of Building Technology for use of post installed anchors in nuclear power plants was the basis used for specification of the additional tests.

Examples of tests include:

1. Pull-out test; the anchor was tested in a 1.0 mm wide concrete crack
2. Pull-out test; the anchor was tested in a 1.5 mm wide concrete crack

Load-deformation diagram of a pull-out test showing the constant load increase with low deformation until maximum load is achieved.
3. Performance test in an opening and closing concrete crack

For this purpose, 10 oscillations were applied with a frequency of 0.2 Hz; the concrete crack varying between 1.0 and 1.5 mm, while the cast-in channel was subjected to a constant tension load. A pull-out test was subsequently carried out in the widest concrete crack of 1.5 mm.

4. Cyclic load change in a wide concrete crack

In this test, cracks in the concrete were opened to 1.5 mm and a tension load applied to the cast-in channel. The load was then completely removed from the cast-in channel. In this test 15 load cycles with a frequency $F < 1$ Hz were applied. A pull-out test was subsequently carried out in the widest (1.5 mm) concrete crack.

Load-displacement diagram - even after the cyclic load test the final pull-out test shows a steady increase with only low deformation.

Test setup for cyclic load test

Load-displacement diagram: shows ductile behaviour during the final pull-out test.

</tr>
</tbody>
</table>

* Concrete load capacity has to be verified for each individual case (taking the geometric boundary conditions into account).

Seismic performance categories C1 and C2

HALFEN HZA-PS 53/34 Cast-in channels have been tested under simulated seismic tension and shear loads according to EOTA TR 049 for seismic performance categories C1 and C2. The assessment of the test results was done by the Technical University of Kaiserslautern and can be found in the test report. Available on request.

Load capacities of HZA-PS according to Z-21.4-1691

Loads

All the values shown are design resistance capacities and should therefore be compared against fully factored loads.

e.g.  \[ F_{Ed} = \gamma_{G} G_{k} + \gamma_{Q} Q_{k} \]

Design steel resistance \( F_{Rd} \)

\( F_{Rd} \) with simultaneous loading in all directions

To check:

1. \( F_{Ed} = \sqrt{N_{Ed}^2 + V_{Ed}^2 + V_{Ed}^2} \leq F_{Rd} \)
2. \( V_{x,Ed} \leq 0.8 \times F_{Rd} \) (single load)

<table>
<thead>
<tr>
<th>HZA-PS profile</th>

<td>30.8</td>
</tr>
<tr>
<td>38/23</td>
<td>16.8</td>
</tr>
<tr>
<td>29/20</td>
<td>11.2</td>
</tr>
</tbody>
</table>

where:

\( \gamma_{G} \) = partial factor for permanent loads
\( G_{k} \) = characteristic value of permanent loads (dead load)
\( \gamma_{Q} \) = partial factor for variable loads
\( Q_{k} \) = characteristic value of variable loads (imposed or live load)

Intermediate values may be linearly interpolated.

Sufficient concrete resistances are provided if the boundary conditions are in accordance with the approval Z-21.4-1691 and the Technical Product Information for HALFEN Cast-in channels.

Extraordinary impact loads from external (EVA) or internal (EVI) forces are given in the Evaluation Report TU Dortmund. Available on request. Also see page 3.
Planning with HALFEN products provide a wide range of possible design solutions: Nuclear power plants (EVA and EVI impact load requirements); sewage plants with larger pipe sizes; very long cable runs; pipe supply lines in utility or other types of tunnels; various other fixings, even to curved or slanted surfaces.

More than 90 Years of HALFEN experience is packed into our products. Contact the HALFEN support team to design and effectively dimension a project. See the back of the catalogue for contact addresses or go to www.halfen.com
Example: designing with the HALFEN Engineering Support Team

Our technical support team starts with outline drawings, which should include some basic information.

Standard and custom elements are combined when designing a pipe support system; this ensures the best and most economical solution for a specific project. The HALFEN Engineering Support Team always strive to achieve the best balance between safety and economy. Always working in close cooperation with the customer throughout the design process to find the best connections for a project. See the back of the catalogue for contact addresses or go to www.halfen.com

Example of a medium duty framing channel ring HCS–SRI. Available in hot-dip galvanized and in stainless steel.

HALFEN HZA-PS POWER SOLUTION
System Solutions/Application Examples

A revolution in pipe support in tunnels! The HALFEN Adjustable cantilever combines the acclaimed high load bearing capacity of the medium duty system with a much faster installation. Specially designed for use in tunnels or other applications with curved or slanted surfaces. It is not necessary to know the cantilever angles at planning. One part for all fixings, dramatically reduces complexity.
No custom cantilevers required, no angles to measure.
